

Low Level Laser Therapy & Legions testimonials

Legions

Marjie Orser - Palm Springs, CA.

A lesion under the tip of the tongue was found on routine examination on a 17 year old male patient in April, 2004 (photo #1 at left). The patient was referred to an oral surgeon and the lesion was removed April 04, 2004 and sent for laboratory evaluation. The pathology report diagnosed the lesion as nonmalignant Mucosal. On June 29, 2004, less than three months from the time of the surgical removal, the lesion was back again, only this time it was twice the size (see photo #2 at right). Rather than repeating the surgery, the lesion was treated with low level laser therapy. The 660 Enhancer followed by mode 1 of the Q1000 was applied for three minutes on June 29, 2004. The patient received similar laser treatments on June 30th and on July 1st and in just two days the lesion had shrunk in size by over one half. Four more laser treatments were repeated on July 6th, 7th, 8th, and 9th. The patient returned on July 19th and in just 2 ½ weeks the lesion had totally healed (photo #3 at left)! While Mucosal lesions are not life threatening, they are annoying and worrisome to the patient and normally require painful surgery to remove them. This case history presents a better, more comfortable way to treat lesions of the mouth. Because this method of treatment is so comfortable and safe, low level laser therapy should be considered as the first choice of treatment for any oral lesions or lesions on any other part of the body.
