

Low Level Laser Therapy & interstitial cystitis clinical research

Combined therapy of interstitial cystitis using the "Aeltis-Synchro-02- Iarilo" device *Urologiia. 2004 Mar-Apr;(2):20-2.* [Article in Russian] **Kalinina SN, Molchanov AV, Rutskaia NS.**

Multiple modality therapy of interstitial cystitis (IC)--the disease characterized by nicturia, pelvic pains, imperative pollakiuria--is considered. As IC nature is not well known, its treatment remains empiric. Among the underlying causes, most probable are autoimmune, allergic, infectious, neurological, vascular. Therefore, the treatment should be multi-modality. Most usable now is combined chemotherapy. Perspective is also IC treatment with medicines in combination with physiotherapy (electromagnetolaser AELTIS-SYNCHRO-02-YARILO"). Endovesical electrophoresis can be also applied.
