

Low Level Laser Therapy & myocarditis clinical research

The quantum gravitational therapy of myocarditis

Ovcharova AP. Lik Sprava. 1999 Apr-May;(3):95-7.

Complex therapy of myocarditis of rheumatic and non-rheumatic genesis using intravascular laser irradiation of blood, quercitrol, and enterosgel has an antiinflammatory, antioxidant action, improves myocardial contractility, is endowed with an antiaggregatory activity. The above therapeutic complex permits the reduction of the non-steroid antiinflammatory drugs intake as well as of the average time of hospital treatment by 2 to 3 days, it also makes for an earlier medical and social rehabilitation of patients.
